We are not adding more work. We are letting the system remember what people should not have to remember.

Opening

Good morning, everyone.

My name is Jing Yang, from the ELM Tech team.

Today, I would like to share a small automation project called Zero Loop Standard Work.

It started with one simple question:

How can we stop relying on memory for our daily IT checks?

Slide 1 - Background and Pain Points

As Shift IT, we have many daily, weekly, and monthly tasks. We check dashboards, review tickets, check systems, attend meetings, and send the shift report.

The tasks are not difficult, but there are many of them. When meetings or urgent issues come in, a routine task can be delayed or forgotten.

One evening, after a busy day, I suddenly thought:

Wait, did I finish the PMX server check today?

I could not remember, and there was no simple place to check.

So the main pain points were clear: tasks were easy to forget, status was hard to track, and new team members did not have one clear task list.

I wanted to change from people looking for tasks to tasks looking for people.

Slide 2 - The Solution

I built a simple solution with Microsoft 365 tools that we already use.

SharePoint stores the task template and today's checklist.

Power Automate creates the right tasks based on daily, weekly, and monthly rules. It also prevents duplicate tasks.

Teams reminds the team when a task is due and still open.

Outlook will provide the end-of-shift summary.

SharePoint stores the work. Power Automate runs it. Teams reminds us. Outlook closes the loop.

The idea is simple. The system handles the reminder, while the engineer still performs the check and makes the decision.

Slide 3 - Status and Next Steps

Today, the task template, daily checklist, automatic task creation, schedule rules, and duplicate prevention are working.

The Teams reminder and status update have also been tested. We are now improving the reminder experience before wider use.

The next step is to send one clear reminder summary instead of many separate cards.

After that, we will add a simple end-of-shift report and use the history to understand completion trends and common exceptions.

The project also gives us three lessons:

Start small. A simple list and a few low-code flows can already create value.

Automate memory, not judgment. The system reminds; the engineer decides and acts.

Design for reuse. The same idea can support other teams with recurring work.

Closing

To summarize, this project moves our standard work from personal memory to a shared and visible system.

We are not adding more work. We are letting the system remember what people should not have to remember.

Hopefully, this means fewer late-night questions like, “Did I finish that check today?”

Thank you.

Quick Speaking Notes

Part	Tip
Opening	Smile and speak slowly.
Slide 1	Pause after the PMX server-check question.
Slide 2	Point from left to right: SharePoint, Power Automate, Teams, Outlook.
Slide 3	Slow down when saying the three lessons.
Closing	Pause after “We are not adding more work.”
