

Zero Loop Standard Work

5-Minute IT Town Hall Speech Script

Target length About 5 minutes	Style Simple and conversational	Slides 5 slides
---	---	---------------------------

We are not adding more work. We are making standard work easier to remember and easier to reuse.

Opening

Good morning, everyone.

My name is Jing Yang, from the ELM Tech team.

Today, I would like to share a small project called Zero Loop Standard Work.

In Shift IT, most of our routine tasks are not difficult. The challenge is that a normal workday can change very quickly. A meeting can be added at short notice, an urgent issue can appear, and a routine check can easily move to the background.

This project is about two simple ideas: helping standard work find us at the right time, and helping us reuse the knowledge from issues we have already solved.

Slide 2 - A Preventable Business Impact

Let me start with a real example.

One day, I joined a temporary meeting and then needed to handle an urgent issue. During a normal shift, I should also check the communication status between PMX and SAP.

Because my attention moved to the urgent work, this routine check was delayed. An On Hold message was not handled quickly enough, and this affected the business.

The important point is that this situation was avoidable.

The issue was not that the task was difficult, or that the team did not know how to handle it. The gap was that the task depended too much on personal memory during a busy day.

A clear reminder, sent at the right time with the correct link and clear ownership, could have helped us identify the exception earlier.

Slide 3 - Standard Work 1: Daily Checklist Automation

The first solution is Daily Checklist Automation.

We maintain a standard task template for daily, weekly, and monthly activities. When a task is due and is still open, the system sends a reminder to the team.

However, the reminder is not only a message saying, "Please remember to do this." It also includes the standard check method, the expected result, the related knowledge article, the work instruction, and the direct link to the checklist.

For example, the reminder may say, "PMX-SAP communication check is due." From the same reminder, the engineer can open the checklist, review the related KB, and follow the standard guidance.

The engineer still performs the check and makes the decision. The system only helps us remember the task and quickly find the information needed to complete it.

This also gives the team better visibility of completed tasks, pending tasks, and exceptions. For new team members, it provides a clear starting point instead of relying only on verbal handover.

Slide 4 - Standard Work 2: IT Issue Solution Finder

The second solution is the IT Issue Solution Finder Agent.

Our team has handled many issues in the past. The solutions may be recorded in ServiceNow tickets, KB articles, or issue notes. The information is available, but it can take time to find the most relevant case, especially when we are under pressure.

With this Agent, the user can provide an error screenshot or enter a few key words. The Agent searches historical incidents and knowledge content, then provides possible root causes, standard handling steps, and related ServiceNow ticket numbers for reference.

The slide shows a simple example. An error screenshot is provided to the Agent. It identifies key information from the message and finds similar historical cases.

The Agent does not replace the engineer's judgment, and the result still needs to be checked. Its value is that it provides a faster and more consistent starting point, and it allows the team to reuse previous experience.

Slide 5 - Summary and Next Steps

To summarize, these two solutions support different parts of our work.

Daily Checklist Automation helps us complete the right work at the right time. The IT Issue Solution Finder helps us solve recurring issues in a more consistent way.

Together, they can also help new team members learn standard tasks and troubleshooting methods more quickly.

The next step is to continue adding and validating KB articles and historical issue information. As the knowledge base grows, the Agent should be able to provide more relevant and accurate guidance.

The same approach can also be adapted for other departments that have recurring checks or repeated operational issues. We can reuse the framework without starting from zero each time.

Closing

The main idea is simple:

We are not adding more work. We are making standard work easier to remember and easier to reuse.

Hopefully, this will help us prevent avoidable issues, respond faster, and share team knowledge more effectively.

Thank you.

Quick Speaking Notes

Part	Tip
Opening	Speak slowly and introduce the two ideas clearly.
Slide 2	Pause after saying the impact was avoidable.
Slide 3	Emphasize that the system reminds, but the engineer decides.
Slide 4	Point to the screenshot and explain the three steps briefly.
Slide 5	Slow down for the final summary and closing sentence.
